下午3:00—4:00

报告地点: 科技综合楼三层 311 计算数学所报告厅

Abstract:

The talk will overview some recent contributions on several theoretical aspects and

numerical approaches in stochastic homogenization for the modelling of random materials. In particular, some variants of the classical theory of stochastic homogenization will be presented. Several numerical approaches will be presented, for acceleration of convergence in the deterministic and the stochastic cases, as well as for approximation of the stochastic problem when the random character is only a perturbation of a deterministic model.

The talk is based upon a series of joint works with PL Lions (College de France), X. Blanc (Paris 6 and CEA), A. Anantharaman, R. Costaouec and F. Legoll (ENPC and INRIA).
